- Best innovative IT solution for healthcare, [Comnews 2016](#)

Experience in E-healthcare

Since 2011, Netrika has successfully completed over 100 healthcare-related projects in 15 regions of Russia based on N3.Healthcare integration platform.

N3.Healthcare connects information systems that serve over 25 million patients.

N3.Healthcare has 14 modules that cover core regional healthcare processes including:

electronic appointment scheduling	patient identity management
integrated electronic medical record	patient referral management
laboratory data exchange	business intelligence
diagnostic imaging exchange	terminology service

N3.Healthcare provides standardized data exchange between local and national-level information systems, as well as between healthcare facilities, regional governments and federal authorities. Exchange protocols are based on HL7 FHIR®.

Technologies

We use web technologies and international standards to build an open network where health care providers interact. We use HL7 FHIR to ensure semantic interoperability and IHE profiles to build business processes.

Access control is provided by distributed authentication mechanisms (standards: OpenID + JWT, RFC 7519), and policies-based authorization (aka ABAC, using standards: XACML, OAuth 2.0, JWT). Legitimacy of data-exchange is ensured by using EDS.
